[Certain aspects of combined vibration training for the treatment of neurological manifestations of osteochondrosis in the lumbar spine region].
[Effect of an 8-week vibration training program on the elderly.
[Effect of whole body vibration exercise on osteoporotic risk factors.
[Effect of whole body vibration on the neuromuscular performance of females 65 years and older. One-year results of the controlled randomized ELVIS study.
[Effect of two different types of whole body vibration on neuromuscular performance and body composition in postmenopausal women.
[Effects of vibrotherapy on postural control, functionality and fatigue in multiple sclerosis patients. A randomised clinical trial.
[Incontinence after radical prostatectomy and cystectomy: are combined training with mechanical devices and whole body vibration effective?
[Influence of vibration exercise on leukocytes and platelets in athletes.
[Musculoskeletal effects of vibration training in the elderly.
[Non-medicinal treatments of spasticity in multiple sclerosis.
[Patterns of osteoprotegerin or nuclear factor kappa B ligand gene expression in the treatment of bone defect with bone marrow stem cells.
[Purr as a cat--and avoid osteoporosis.
[Regulating effects of whole-body vibration on protein expression of p-GSK3β in bone marrow cells of ovariectomized osteoporosis rats.
[Sarcopenia and whole body vibration training: an overview.
[Special training therapy to reduce inflammation in Anti-Jo-1 syndrome.
[Stabilometric studies of the effect of dosed vibration on erect posture parameters in athletes.
[Strength training with superimposed vibrations.
[The influence of posture on transmission and absorption of vibration energy in whole body vibration exercise.
[The influence of vibration training in combination with general magnetotherapy on dynamics of performance efficiency in athletes.
[Using vibration training for the treatment of neurological manifestations of osteochondrosis in the lumbar spine region.
[Vibrational physical exercises as the rehabilitation in gerontology.
[Vitreous hemorrhage and whole-body vibration training--is there an association?.
[What can we think about whole-body-vibration in elderly people?.
[Whole body vibration (acceleration) training increases bone mineral density and serum levels of osteocalcin in elderly women.
[20-Hz whole body vibration training fails to counteract the decrease in leg muscle volume caused by 14 days of 6 degrees head down tilt.
A comparison of the effect of two types of vibration exercise on the endocrine and musculoskeletal system.
A comparison of the physiologic effects of acute whole-body vibration exercise in young and older people.
A comparison of training intensity between whole body vibration and conventional squat exercise.
A comparison of whole body vibration and moist heat on lower extremity skin temperature and skin blood flow in healthy older individuals.
A comparison of whole-body vibration and resistance training on total work in the rotator cuff.
A novel vibration device for neuromuscular stimulation for sports and rehabilitation applications.
A systematic review of supported standing programs.
A vibratory bar for upper body: feasibility and acute effects on EMGrms activity.
Active recovery strategies and handgrip performance in trained vs. untrained climbers.
Acute and cumulative effects of focused high-frequency vibrations on the endocrine system and muscle strength.
Acute and residual effects of vibratory stimulation on explosive strength in elite and amateur athletes.
Acute bone marker responses to whole-body vibration and resistance exercise in young women.
Acute changes in neuromuscular excitability after exhaustive whole body vibration exercise as compared to exhaustion by squatting exercise.
Acute effect of upper-body vibration on performance in master swimmers.
Acute effect of whole-body vibration on power, one-repetition maximum, and muscle activation in power lifters.
Acute effect of whole-body vibration on sprint and jumping performance in elite skeleton athletes.
Acute effects of a vibration-like stimulus during knee extension exercise.
Acute effects of passive stretching and vibration on the electromechanical delay and musculotendinous stiffness of the plantar flexors.
Acute effects of passive stretching vs vibration on the neuromuscular function of the plantar flexors.
Acute Effects of Resistance Training with Local Vibration.
Acute effects of various whole body vibration frequencies on 1RM in trained and untrained subjects.
Acute effects of various whole-body vibration frequencies on lower-body power in trained and untrained subjects.
Acute effects of whole body vibration during passive standing on soleus H-reflex in subjects with and without spinal cord injury.
Acute effects of whole-body vibration at 3, 6, and 9 hz on balance and gait in patients with Parkinson's disease.
Acute effects of whole-body vibration on jump force and jump rate of force development: a comparative study of different devices.
Acute effects of whole-body vibration on lower extremity muscle performance in persons with multiple sclerosis.

Acute effects of whole-body vibration on muscle activity, strength, and power.

Acute effects of whole-body vibration on neuromuscular responses in older individuals: implications for prescription of vibratory stimuli.

Acute effects of whole-body vibration on trunk muscles in young healthy adults.

Acute enhancement of lower-extremity dynamic strength and flexibility with whole-body vibration.

Acute exercise with whole-body vibration decreases wave reflection and leg arterial stiffness.

Acute physiological effects of exhaustive whole-body vibration exercise in man.

Acute whole body vibration training increases vertical jump and flexibility performance in elite female field hockey players.

Acute whole-body vibration elicits post-activation potentiation.

Adaptations of Mouse Skeletal Muscle to Low-Intensity Vibration Training.

Adaptive responses of human skeletal muscle to vibration exposure.

Addition of synchronous whole-body vibration to body mass resistive exercise causes little or no effects on muscle damage and/or inflammation.

Adipogenesis is inhibited by brief, daily exposure to high-frequency, extremely low-magnitude mechanical signals.

Aerobic exercise and whole-body vibration in offsetting bone loss in older adults.

Alternative Exercise Technologies to Fight against Sarcopenia at Old Age: A Series of Studies and Review.

An antidote to bed rest?

Anaerobic power in road cyclists is improved after 10 weeks of whole-body vibration training.

Analysis of muscle fatigue induced by isometric vibration exercise at varying frequencies.

Anti-spastic effects of the direct application of vibratory stimuli to the spastic muscles of hemiplegic limbs in post-stroke patients: a proof-of-concept study.

Arterial stiffness acutely decreases after whole-body vibration in humans.

Autonomic neural functions in space.

Balance training and exercise in geriatric patients.

Benefits of whole-body vibration with an oscillating platform for people with multiple sclerosis: a systematic review.

Biological reaction to vibration—implications for sport.

Bone strength and density via pQCT in post-menopausal osteopenic women after 9 months resistive exercise with whole body vibration.

Bone structure and density via HR-pQCT in 60d bed-rest, 2-years recovery with and without countermeasures.

Brief daily exposure to low-intensity vibration mitigates the degradation of the intervertebral disc in a frequency-specific manner.

Case study: Use of vibration therapy in the treatment of diabetic peripheral small fiber neuropathy.

Changes in balance, functional performance and fall risk following whole body vibration training and vitamin D supplementation in institutionalized elderly people.

Changes in illusory ankle movements induced by tendon vibrations during the delayed recovery phase of stretch-shortening cycle fatigue.

Changes in lower extremity muscle function after 56 days of bed rest.

Characteristics of fast voluntary and electrically evoked isometric knee extensions during 56 days of bed rest with and without exercise.

Characterization of a novel instrument for vibration exercise.

Chronic effects of different frequencies of local vibrations.

Chronic effects of whole-body vibration on jumping performance and body balance using different frequencies and amplitudes with identical acceleration load.

Clinical efficacy and safety evaluation of a monopolar radiofrequency device with a new vibration handpiece for the treatment of facial rhytids.

Combination of External Load and Whole Body Vibration Potentiates the GH-releasing Effect of Squatting in Healthy Females.

Combined effects of whole-body vibration, resistance exercise, and vascular occlusion on skeletal muscle and performance.

Combined whole body vibration and balance training using Vibrosphere®: improvement of trunk stability, muscle tone, and postural control.

Comparing muscle temperature during static and dynamic squatting with and without whole-body vibration.

Comparing the performance-enhancing effects of squats on a vibration platform with conventional squats in recreationally resistance-trained men.

Continuous versus intermittent stochastic resonance whole body vibration and its effect on pelvic floor muscle activity.

Controlled whole body vibration to decrease fall risk and improve health-related quality of life of nursing home residents.

Controlling balance decline across the menopause using a balance-strategy training program: a randomized, controlled trial.

Countermeasures posteffects following prolonged exposure to whole-body vibration: a sensorimotor treatment.

Countermeasures against lumbar spine deconditioning in prolonged bed rest and the influence of exercise countermeasures.

Daily muscle vibration amelioration of neural impairments of the soleus muscle during 2 weeks of immobilization.

Determining the optimal whole-body vibration dose-response relationship for muscle performance.

Differential atrophy of the postero-lateral hip musculature during prolonged bed rest and the influence of exercise countermeasures.

Displacement and frequency for maximizing power output resulting from a bout of whole-body vibration.

Do increases in selected fitness parameters affect the aesthetic aspects of classical ballet performance?

Do whole-body vibration exercise and resistance exercise modify concentrations of salivary cortisol and immunoglobulin A?
Does vibration counteract the static stretch-induced deficit on muscle force development?
Does whole-body vibration training have acute residual effects on postural control ability of elderly women?
Does whole-body vibration with alternative tilting increase bone mineral density and change bone metabolism in senior people?
Effect of 12 months of whole-body vibration therapy on bone density and structure in postmenopausal women: a randomized trial.
Effect of 4-min vertical whole-body vibration on muscle performance and body balance: a randomized cross-over study.
Effect of 6-month whole body vibration training on hip density, muscle strength, and postural control in postmenopausal women: a randomised, controlled study.
Effect of 8-month vertical whole-body vibration on bone, muscle performance, and balance: a randomized controlled study.
Effect of a new physiotherapy concept on bone mineral density, muscle force and gross motor function in children with bilateral cerebral palsy.
Effect of a vibration exposure on muscular performance and body balance. Randomized cross-over study.
Effect of acute and chronic whole-body vibration exercise on serum insulin-like growth factor-1 levels in women with fibromyalgia.
Effect of an acute bout of whole body vibration exercise on muscle force output and motor neuron excitability.
Effect of chest wall vibration on dyspnea during exercise in chronic obstructive pulmonary disease.
Effect of chest wall vibration on dyspnea during hypercapnia and exercise in chronic obstructive pulmonary disease.
Effect of four-month vertical whole body vibration on performance and balance.
Effect of iTonic whole-body vibration on delayed-onset muscle soreness among untrained individuals.
Effect of long-term whole-body vibration training on visceral adipose tissue: a preliminary report.
Effect of prolonged bed rest on the anterior hip muscles.
Effect of standing posture during whole-body vibration training on muscle morphology and function in older adults: a randomised controlled trial.
Effect of vibration during fatiguing resistance exercise on subsequent muscle activity during maximal voluntary isometric contractions.
Effect of vibration stimulation on dysbasia of spastic paraplegia in neuromyelitis optica: a possible example of neuronal plasticity.
Effect of vibration training in maximal effort (70% 1RM) dynamic bicep curls.
Effect of vibration training on neuromuscular output with ballistic knee extensions.
Effect of vibration treatment on symptoms associated with eccentric exercise-induced muscle damage.
Effect of whole-body vibration (WBV) on bone density and bone quality in osteopenic girls with adolescent idiopathic scoliosis.
Effect of whole-body vibration exercise on muscle strength and proprioception in females with knee osteoarthritis.
Effect of whole-body vibration in Parkinson's disease: a controlled study.
Effect of Whole Body Vibration on Delayed Onset Muscle Soreness, Flexibility, and Power.
Effect of whole-body vibration on intracompartamental pressure in the lower leg.
Effect of whole-body vibration on leg muscle strength after healed burns: a randomized controlled trial.
Effect of whole-body vibration training on lower limb performance in selected high-level ballet students.
Effect of whole-body vibration training on mobility in children with cerebral palsy: a randomized controlled experimenter-blinded study.
Effect of whole-body vibration exercise and muscle strengthening, balance, and walking exercises on walking ability in the elderly.
Effect of whole-body vibration exercise on balance in women with fibromyalgia syndrome: a randomized controlled trial.
Effect of whole-body vibration exercise on lumbar bone mineral density, bone turnover, and chronic back pain in post-menopausal osteoporosis.
Effect of whole-body vibration on BMD: a systematic review and meta-analysis.
Effect of whole-body vibration on bone properties in aging mice.
Effect of whole-body vibration on neuromuscular performance and body composition for females 65 years and older: a randomized-controlled trial.
Effect of whole-body vibration on quadriceps spasticity in individuals with spastic hypertonia due to spinal cord injury.
Effect of whole-body vibration warm-up on bat speed in women softball players.
EFFECTIVENESS OF DIFFERENT POST ACTIVATION POTENTIATION PROTOCOLS WITH AND WITHOUT WHOLE BODY VIBRATION.
Effectiveness of low-frequency vibration recovery method on blood lactate removal, muscle contractile properties and on time to exhaustion.
Effects of 24 weeks of whole body vibration training on body composition and muscle strength in untrained females.
Effects of 3 weeks' whole-body vibration training on muscle strength and functional mobility in hospitalized persons with multiple sclerosis.
Effects of 5 minutes of neck-muscle vibration immediately before occupational therapy on unilateral spatial neglect.
Effects of 6 weeks of periodized squat training with or without whole-body vibration on short-term adaptations in jump performance with highest leg dominance.
Effects of 8 weeks of vibration training at different frequencies (1 or 15 Hz) in senior sportmen on torque and force development and muscle damage.
Effects of a 6-week periodized squat training program with or without whole-body vibration on jump height and power output following a single bout of heavy training.
Effects of a 6-week periodized squat training with or without whole-body vibration upon short-term adaptations in squat strength and balance.
Effects of a short-term whole body vibration intervention on physical fitness in elderly people.
Effects of a single session of whole body vibration on ankle plantarflexion spasticity and gait performance in patients with chronic stroke.
Effects of adding whole body vibration to squat training on isometric force/time characteristics.
Effects of aerobic exercise and whole body vibration on glycæmia control in type 2 diabetic males.
Effects of combined whole-body vibration and resistance training on muscular strength and bone metabolism in postmenopausal women.
Effects of combining whole-body vibration with exercise on the consequences of detraining on muscle performance in untrained adults.
Effects of different magnitudes of whole-body vibration on arm muscular performance.
Effects of different vibration exercises on bench press.
Effects of exercise equipment on the microgravity environment.
Effects of individualized whole-body vibration on muscle flexibility and mechanical power.
Effects of local pressure and vibration on muscle pain from eccentric exercise and hypertonic saline.
Effects of low-frequency whole-body vibration on motor-evoked potentials in healthy men.
Effects of low-magnitude, high-frequency mechanical stimulation in the rat osteopenia model.
Effects of mechanical vibration applied in the opposite direction of muscle shortening on maximal isometric strength.
Effects of muscular strength, exercise order, and acute whole-body vibration exposure on bat swing speed.
Effects of random whole-body vibration on postural control in Parkinson's disease.
Effects of short-term vibration and hypoxia during high-intensity cycling exercise on circulating levels of angiogenic regulators in humans.
Effects of supplemental training on fitness and aesthetic competence parameters in contemporary dance: a randomised controlled trial.
Effects of the different frequencies of whole-body vibration during the recovery phase after exhaustive exercise.
Effects of training on bone mass in older adults: a systematic review.
Effects of vibration and resistance training on neuromuscular and hormonal measures.
Effects of vibration exercise on muscle performance and mobility in an older population.
Effects of vibration training on bone metabolism: results from a short-term bed rest study.
Effects of vibration training on force production in female basketball players.
Effects of vibration training on muscle power: a meta-analysis.
Effects of vibration training on muscle strength: a meta-analysis.
Effects of vibration treatment on tibial bone of ovariectomized rats analyzed by in vivo micro-CT.
Effects of vibrations on gastrocnemius medialis tissue oxygenation.
Effects of whole body vibration in patients with chronic obstructive pulmonary disease—a randomized controlled trial.
Effects of whole body vibration on bone mineral density and falls: results of the randomized controlled ELVIS study with postmenopausal women.
Effects of whole body vibration on postural steadiness in an older population.
Effects of whole body vibration on strength and functional mobility in multiple sclerosis.
Effects of whole body vibration on the skeleton and other organ systems in man and animal models: what we know and what we need to know.
Effects of whole body vibration therapy on main outcome measures for chronic non-specific low back pain: a single-blind randomized controlled trial.
Effects of whole body vibration training on body composition in adolescents with Down syndrome.
Effects of whole body vibration training on cardiorespiratory fitness and muscle strength in older individuals (a 1-year randomised controlled trial). 
Effects of whole body vibration training on postural control in older individuals: a 1 year randomized controlled trial.
Effects of whole-body vibration and resistance training on knee extensors muscular performance.
Effects of whole-body vibration exercise on lower-extremity muscle strength and power in an older population: a randomized clinical trial.
Effects of whole-body vibration exercise on the endocrine system of healthy men.
Effects of whole-body vibration on blood flow and neuromuscular activity in spinal cord injury.
Effects of Whole-Body Vibration on Muscle Architecture, Muscle Strength, and Balance in Stroke Patients
Effects of whole-body vibration on postural control in elderly: a systematic review and meta-analysis.
Effects of whole-body vibration on sensorimotor performance in people with Parkinson disease: a systematic review.
Effects of whole-body vibration training on different devices on bone mineral density.
Effects of whole-body vibration training on explosive strength and postural control in young female athletes.
Effects of whole-body vibration with or without localized radiofrequency on anthropometry, body composition, and motor performance.
Effects on leg muscular performance from whole-body vibration exercise: a systematic review.
Efficacy of a whole-body vibration intervention on functional performance of community-dwelling older adults.
Efficacy of a whole-body vibration intervention to effect exercise tolerance and functional performance of the lower limbs of people with chronic obstructive pulmonary disease: a systematic review.
Efficacy of whole body vibration exercise in older people: a systematic review.
Efficiency of vibration exercise for glycemic control in type 2 diabetes patients.
Elbow joint position sense after neuromuscular training with handheld vibration.
Electromyographic assessment of muscle fatigue during isometric vibration training at varying frequencies.
Electromyographic hyperactivation of skeletal muscles by time-modulated mechanical stimulation.
Energy metabolism in human calf muscle performing isometric plantar flexion superimposed by 20-Hz vibration.
Enhanced myofiber recruitment during exhaustive squatting performed as whole-body vibration exercise.
Evaluation of muscle activity for loaded and unloaded dynamic squats during vertical whole-body vibration.
Evidence for an additional effect of whole-body vibration above resistive exercise alone in preventing bone loss during prolonged bed rest.
Exercise for improving balance in older people.
Exercise therapy for fibromyalgia.
Exercise with vibration dumb-bell enhances neuromuscular excitability measured using TMS.
Exploring the effects of a 20-week whole-body vibration training programme on leg muscle performance and function in persons with multiple sclerosis.
Expression and regulation of Homer in human skeletal muscle during neuromuscular junction adaptation to disuse and exercise.
Fitness efficacy of vibratory exercise compared to walking in postmenopausal women.
From space to Earth: advances in human physiology from 20 years of bed rest studies (1986-2006).
Functional performance and inflammatory cytokines after squat exercises and whole-body vibration in elderly individuals with knee osteoarthritis.
Gastrocnemius medialis and vastus lateralis oxygenation during whole-body vibration exercise.
GH responses to two consecutive bouts of whole body vibration, maximal voluntary contractions or vibration alternated with maximal exercise.
Good, good, good... good vibrations: the best option for better bones?
Growth hormone and lactate responses induced by maximal isometric voluntary contractions and whole-body vibrations in healthy subjects.
Growth hormone-releasing effects of whole body vibration alone or combined with squatting plus external load in severely obese females.
High-density surface EMG study on the time course of central nervous and peripheral neuromuscular changes during 8 weeks of bed rest.
High-frequency and low-magnitude whole body vibration with rest days is more effective in improving skeletal micro-morphology and function in ovariectomized rats.
High-frequency vibration training able to increase muscle power in postmenopausal women.
High-frequency whole-body vibration improves balancing ability in elderly women.
High-frequency, low-intensity vibrations increase bone mass and muscle strength in upper limbs, improving autonomy in disabled children.
Highly demanding resistive vibration exercise program is tolerated during 56 days of strict bed-rest.
Hormonal responses to a single session of wholebody vibration exercise in older individuals.
Hormonal responses to whole-body vibration in men.
Human skeletal muscle structure and function preserved by vibration muscle exercise following 55 days of bed rest.
Immediate effects of 2 different whole-body vibration frequencies on muscle peak torque and stiffness.
Impact of bed rest on conduit artery remodeling: effect of exercise countermeasures.
Impact of whole-body vibration training versus fitness training on muscle strength and muscle mass in older men: a 1-year randomized controlled trial.
Improvement of femoral bone quality after low-magnitude, high-frequency mechanical stimulation in the ovariectomized rat as an osteoporosis model.
Improving strength and postural control in young skiers: whole-body vibration versus equivalent resistance training.
In rat with glucocorticoid-induced osteoporosis, RANKL is downregulated in bone cells by physical activity (treadmill and vibration stimuli).
Inconsistently used terminology in whole body vibration exercise research.
Increased secretion of salivary glands produced by facial vibrotactile stimulation.
Increased susceptibility of arterial tissue to wire perforation with the application of high-frequency mechanical vibrations.
Increases in muscle activity produced by vibration of the thigh muscles during locomotion in chronic human spinal cord injury.
INDIVIDUAL OPTIMAL FREQUENCY IN WHOLE BODY VIBRATION: EFFECT OF PROTOCOL, JOINT ANGLE AND FATIGUE LEVEL.
Influence of resistance load on neuromuscular response to vibration training.
Influence of vibration on delayed onset of muscle soreness following eccentric exercise.
Influence of vibration on mechanical power and electromyogram activity in human arm flexor muscles.
Influence of vibration resistance training on knee extensor and plantar flexor size, strength, and contractile speed characteristics after 6 months.
Influence of vibration training on energy expenditure in active men.
Influence of whole body vibration platform frequency on neuromuscular performance of community-dwelling older adults.
Influence of whole-body vibration static exercise on quadriceps oxygenation.
Influence of whole-body vibration time on peri-implant bone healing: a histomorphometrical animal study.
Initial characterization of the microgravity environment of the international space station: increments 2 through 4.
Intraocular lens dislocation after whole-body vibration.
Is 8 weeks of side-alternating whole-body vibration a safe and acceptable modality to improve functional performance in multiple sclerosis patients?
Is bone formation induced by high-frequency mechanical signals modulated by muscle activity?
Is vibration exercise a useful addition to a weight management program?
Knee extensor fatigability after bedrest for 8 weeks with and without countermeasure.
Loads on a spinal implant measured in vivo during whole-body vibration.
Long term bed rest with and without vibration exercise countermeasures: effects on human muscle protein dysregulation.
Long-term effects of 6-week whole-body vibration on balance recovery and activities of daily living in the postacute phase of stroke: a
Low load exercises targeting the gluteal muscle group acutely enhance explosive power output in elite athletes.

Low resonance frequency vibration affects strength of paretic and non-paretic leg differently in patients with stroke.

Low-amplitude high frequency vibration down-regulates myostatin and atrogin-1 expression, two components of the atrophy pathway in muscle.

Low-frequency vibratory exercise reduces the risk of bone fracture more than walking: a randomized controlled trial.

Low-level accelerations applied in the absence of weight bearing can enhance trabecular bone formation.

Low-level vibrations retain bone marrow's osteogenic potential and augment recovery of trabecular bone during reambulation.

Low-level, high-frequency mechanical signals enhance musculoskeletal development of young women with low BMD.

Low-magnitude high-frequency loading via whole body vibrationenhances bone-implant osseointegration in ovariectomized rats.

Low-magnitude high-frequency vibration (LMHFV) enhances bone remodeling in osteoporotic rat femoral fracture healing.

Low-magnitude whole body vibration does not affect bone mass but does affect weight in ovariectomized rats.

Low-magnitude whole body vibration with resistive exercise as a countermeasure against cardiovascular deconditioning after 60 days of bed rest. Mechanical means to improve bone strength: ultrasound and vibration.

Mechanical stimulation in the form of vibration prevents postmenopausal bone loss in ovariectomized rats.

Mechanical stimuli and bone health: what is the evidence?

Multiple vibration intensities and frequencies for bone mineral density improvement.

Muscle tissue oxygenation and VEGF in VO-matched vibration and squatting exercise.

Neuromuscular activity during whole-body vibration of different amplitudes and footwear conditions: implications for prescription of vibration training.

Neuromuscular and hormonal responses to a single session of whole body vibration exercise in healthy young men.

Neuromuscular ankle joint stabilisation after 4-weeks WBV training.

Neuromuscular fatigue induced by whole-body vibration exercise.

No effects of whole-body vibration training on muscle strength and gait performance in persons with late effects of polio: a pilot study.

No specific effect of whole-body vibration training in chronic stroke: a double-blind randomized controlled study.

Non pharmacological interventions for spasticity in multiple sclerosis.

Non-pharmacological interventions for breathlessness in advanced stages of malignant and non-malignant diseases.

Occurrence of fatigue induced by a whole body vibration session is not frequency dependent.

One session of whole body vibration increases voluntary muscle strength transiently in patients with stroke.

Optimal frequency, displacement, duration, and recovery patterns to maximize power output following acute whole-body vibration.

Optimising whole body vibration training for use in older people.

Osteoporosis: nonpharmacologic management.

Outlasting corticomotor excitability changes induced by 25 Hz whole-hand mechanical stimulation.

Oxygen consumption and heart rate during repeated squatting exercises with or without whole-body vibration in the elderly.

Oxygen uptake during whole-body vibration exercise: comparison with squatting as a slow voluntary movement.

Oxygen uptake in whole-body vibration exercise: influence of vibration frequency, amplitude, and external load.

Pelvic floor stimulation: what are the good vibrations?

Perceived exertion is not necessarily associated with altered brain activity during exercise.

Peripheral arterial and venous response to tilt test after a 60-day bedrest with and without countermeasures (ES-IBREP).

Physical modalities in the treatment of neurological dysfunction.

Physical therapy approaches to reduce fall and fracture risk among older adults.

Platform accelerations of three different whole-body vibration devices and the transmission of vertical vibrations to the lower limbs.

Potential beneficial effects of whole-body vibration for muscle recovery after exercise.

Preliminary results on the mobility after whole body vibration in immobilized children and adolescents.

Prevention of bone loss during 56 days of strict bed rest by side-alternating resistive vibration exercise.

Prolonged muscle vibration reduces maximal voluntary knee extension performance in both the ipsilateral and the contralateral limb in healthy young men.

Proprioceptive and sensorimotor performance in Parkinson's disease.

Rapidly emerging role of whole body vibration therapy in the management of neurologic diseases besides polio.

Rehabilitation after anterior cruciate ligament reconstruction: a systematic review.

Reporting whole-body vibration intervention studies: recommendations of the International Society of Musculoskeletal and Neuronal Interactions.

Resistance training and vibration improve muscle strength and functional capacity in female patients with multiple sclerosis.

Resistive exercise versus resistive vibration exercise to counteract vascular adaptations to bed rest.

Resistive exercises, with or without whole body vibration, prevent vertebral marrow fat accumulation during 60 days of head-down tilt.

Resistive simulated weightbearing exercise with whole body vibration reduces lumbar spine deconditioning in bed-rest.

Resistive vibration exercise attenuates bone and muscle atrophy in 56 days of bed rest: biochemical markers of bone metabolism.
Resistive vibration exercise during bed-rest reduces motor control changes in the lumbo-pelvic musculature.

Resistive vibration exercise reduces lower limb muscle atrophy during 56-day bed-rest.

Resistive vibration exercise retards bone loss in weight-bearing skeletons during 60 days bed rest.

Results of a prospective pilot trial on mobility after whole body vibration in children and adolescents with osteogenesis imperfecta.

Risks and benefits of whole body vibration training in older people.

Ryanodine receptor type-1 (RyR1) expression and protein S-nitrosylation pattern in human soleus myofibres following bed rest and exercise.

Safety and severity of accelerations delivered from whole body vibration exercise devices to standing adults.

Sarcopenia in nursing home residents.

Segmental muscle vibration improves walking in chronic stroke patients with foot drop: a randomized controlled trial.

Serum Concentrations of S100B are not Affected by Cycling to Exhaustion With or Without Vibration.

Short-term effects of whole-body vibration training in younger individuals.

Six weeks of whole-body vibration exercise improves pain and fatigue in women with fibromyalgia.

Skeletal effects of whole-body vibration in adult and aged mice.

Spectral properties of H-reflex recordings after an acute bout of whole-body vibration.

Spinal cord injury-induced osteoporosis: pathogenesis and emerging therapies.

Stochastic resonance in osteogenic response to mechanical loading.

Stochastic resonance stimulation for upper limb rehabilitation poststroke.

Stochastic resonance therapy in Parkinson's disease.

Stochastic resonance training reduces musculoskeletal symptoms in metal manufacturing workers: a controlled preventive intervention study.

Skeletal effects ofwhole-body vibration reduces musculoskeletal pain: A randomized controlled trial.

Stochastic resonance whole body vibration training for chair rising performance on untrained elderly: a pilot study.

Strength increase after whole-body vibration compared with resistance training.

Strength training effects of whole-body vibration?

Strength training with superimposed whole body vibration does not preferentially modulate cortical plasticity.

Strength-Training with Whole-Body Vibration in Long-Distance Runners

Strength, size and activation of knee extensors followed during 8 weeks of horizontal bed rest and the influence of a countermeasure.

Stress fracture and military medical readiness: bridging basic and applied research.

Study protocol: the effect of whole body vibration on acute unilateral unstable lateral ankle sprain- a biphasic randomized controlled trial.

Subjective experiences of men with and without spinal cord injury: tolerability of the juvent and WAVE whole body vibration plates.

Submaximal aerobic exercise with mechanical vibrations improves the functional status of patients with chronic fatigue syndrome.

Summaries for patients: whole-body vibration therapy for the prevention of bone loss.

Superimposed vibration confers no additional benefit compared with resistance training alone.

Synchronous whole-body vibration increases VO2 during and following acute exercise.

Systematically controlling for the influence of age, sex, hertz and time post-whole-body vibration exposure on four measures of physical performance.

Temporal artery flow response during the last minute of a head up tilt test, in relation with orthostatic intolerance after a 60 day head-down bedrest.

Ten-week whole-body vibration training improves body composition and muscle strength in obese women.

Tendon vibration attenuates superficial venous vessel response of the resting limb during static arm exercise.

The 2nd Berlin BedRest Study: protocol and implementation.

The acute effect of vibration exercise on concentric muscular characteristics.

The acute effect of whole-body low-frequency vibration on countermovement vertical jump performance in college-aged men.

The acute effect of whole-body vibration on the vertical jump height.

The acute effects of different whole body vibration amplitudes on the endocrine system of young healthy men: a preliminary study.

The acute effects of different whole-body vibration amplitudes and frequencies on flexibility and vertical jumping performance.

The acute effects of hamstring stretching and vibration on dynamic knee joint range of motion and jump performance.

The acute effects of mechanical vibration on power output in the bench press.

The acute effects of whole-body vibration on gait parameters in adults with cerebral palsy.

The clinical benefits of whole body vibration therapy: beyond its neuromuscular effects.

The effect of 30 Hz vs. 50 Hz passive vibration and duration of vibration on skin blood flow in the arm.

The effect of 6-week exercise programme and whole body vibration on strength and quality of life in women with fibromyalgia: a randomized controlled trial.

The effect of 8 mos of twice-weekly low- or higher intensity whole body vibration on risk factors for postmenopausal hip fracture.

The effect of acute applications of whole-body vibration on the iTonic platform on subsequent lower-body power output during the back squat.

The effect of adding whole-body vibration to squat training on the functional performance and self-report of disease status in elderly patients with knee osteoarthritis: a randomized controlled trial.

The effect of bed rest and an exercise countermeasure on leg venous function.

The effect of early whole-body vibration therapy on neuromuscular control after anterior cruciate ligament reconstruction: a randomized controlled trial.

The effect of mechanical forces (vibration or external compression) on the dermal water content of the upper dermis and epidermis, assessed by high frequency ultrasound.

The effect of running, strength, and vibration strength training on the mechanical, morphological, and biochemical properties of the Achilles tendon.

The effect of vibration therapy on spasticity and motor function in children with cerebral palsy: a randomized controlled trial.

The effect of warm-up with whole-body vibration vs. cycle ergometry on isokinetic dynamometry.

The effect of weight-bearing exercise with low frequency, whole body vibration on lumbosacral proprioception: a pilot study on normal adults.

The effect of whole body vibration exposure on muscle or bone morphology and function in older adults: a systematic review of the literature.

The Effect of Whole Body Vibration on Ankle Range of Motion and the H-reflex.

The effect of whole body vibration on balance, mobility and falls in older adults: a systematic review and meta-analysis.

The effect of whole body vibration on lower extremity skin blood flow in normal subjects.

The effect of whole body vibration short-term exercises on respiratory gas exchange in overweight and obese women.

The effect of whole-body vibration on peri-implant bone healing in rats.

The effects of 11 weeks whole body vibration training on jump height, contractile properties and activation of human knee extensors.

The effects of a 28-Hz vibration on arm muscle activity during isometric exercise.

The effects of acute whole body vibration as a recovery modality following high-intensity interval training in well-trained, middle-aged men.

The effects of adding different whole-body vibration frequencies to preconditioning exercise on subsequent sprint performance.

The effects of bed-rest and countermeasure exercise on the endocrine system in male adults: evidence for immobilization-induced reduction of T3/T4/TSH.

The effects of movement velocity during squatting on energy expenditure and substrate utilization in whole-body vibration.

The effects of passive warm-up vs. Whole-body vibration on high-intensity performance during sprint cycle exercise.

The effects of physical activity on apoptosis and lubricin expression in articular cartilage in rats with glucocorticoid-induced osteoporosis.

The effects of random whole-body vibration on motor symptoms in Parkinson's disease.

The effects of specific preconditioning activities on acute sprint performance.

The effects of vibration therapy on muscle force loss following eccentrically induced muscle damage.

The effects of whole body vibration and exercise on fibrinolysis in men.

The effects of whole body vibration on bone mineral density for a person with a spinal cord injury: a case study.

The effects of whole body vibration on humans: dangerous or advantageous?

The effects of whole-body vibration in isolation or combined with strength training in female athletes.

The effects of whole-body vibration on the cross-transfer of strength.

The effects of whole-body vibration therapy on bone turnover, muscle strength, motor function, and spasticity in chronic stroke: a randomised controlled trial.

The effects of whole-body vibration training and vitamin D supplementation on muscle strength, muscle mass, and bone density in institutionalised elderly women: a 6-month randomized, controlled trial.

The effects of whole-body vibration therapy on bone turnover, muscle strength, motor function, and spasticity in chronic stroke: a randomized controlled trial.

The effects of whole-body vibration training in aging adults: a systematic review.

The effects of whole-body vibration training on gait and walking ability - a systematic review comparing two quality indexes.

The feasibility of Whole Body Vibration in institutionalised elderly persons and its influence on muscle performance, balance and mobility.

The influence of whole body vibration on the plantarflexors during heel raise exercise.

The potential benefits and inherent risks of vibration as a non-drug therapy for the prevention and treatment of osteoporosis.

The rate of muscle temperature increase during acute whole-body vibration exercise.

The potential benefits and inherent risks of vibration as a non-drug therapy for the prevention and treatment of osteoporosis.

The relationship of reduced peripheral nerve function and diabetes with physical performance in older white and black adults: the Health, Aging, and Body Composition (Health ABC) study.

The relationship of reduced peripheral nerve function and diabetes with physical performance in older white and black adults: the Health, Aging, and Body Composition (Health ABC) study.

The effects of adding different whole-body vibration frequencies to preconditioning exercise on subsequent sprint performance.

The effects of bed-rest and countermeasure exercise on the endocrine system in male adults: evidence for immobilization-induced reduction of T3/T4/TSH.

The effects of movement velocity during squatting on energy expenditure and substrate utilization in whole-body vibration.

The effects of passive warm-up vs. Whole-body vibration on high-intensity performance during sprint cycle exercise.

The effects of physical activity on apoptosis and lubricin expression in articular cartilage in rats with glucocorticoid-induced osteoporosis.

The effects of random whole-body vibration on motor symptoms in Parkinson's disease.

The effects of specific preconditioning activities on acute sprint performance.

The effects of vibration therapy on muscle force loss following eccentrically induced muscle damage.

The effects of whole body vibration and exercise on fibrinolysis in men.

The effects of whole body vibration on bone mineral density for a person with a spinal cord injury: a case study.

The effects of whole body vibration on humans: dangerous or advantageous?

The effects of whole-body vibration in isolation or combined with strength training in female athletes.

The effects of whole-body vibration on the cross-transfer of strength.

The effects of whole-body vibration therapy on bone turnover, muscle strength, motor function, and spasticity in chronic stroke: a randomized controlled trial.

The effects of whole-body vibration training and vitamin D supplementation on muscle strength, muscle mass, and bone density in institutionalised elderly women: a 6-month randomized, controlled trial.

The effects of whole-body vibration therapy on bone turnover, muscle strength, motor function, and spasticity in chronic stroke: a randomized controlled trial.

The effects of whole-body vibration training in aging adults: a systematic review.

The effects of whole-body vibration training on gait and walking ability - a systematic review comparing two quality indexes.

The feasibility of Whole Body Vibration in institutionalised elderly persons and its influence on muscle performance, balance and mobility.

The influence of whole body vibration on the plantarflexors during heel raise exercise.

The potential benefits and inherent risks of vibration as a non-drug therapy for the prevention and treatment of osteoporosis.

The rate of muscle temperature increase during acute whole-body vibration exercise.

The potential benefits and inherent risks of vibration as a non-drug therapy for the prevention and treatment of osteoporosis.

The relationship of reduced peripheral nerve function and diabetes with physical performance in older white and black adults: the Health, Aging, and Body Composition (Health ABC) study.

The short-term effect of whole-body vibration training on vertical jump, sprint, and agility performance.

The use of mechanical acoustic vibrations to improve abdominal contour.

The use of vibration as an exercise intervention.

The use of vibration training to enhance muscle strength and power.

The use of whole-body vibration as a golf warm-up.

The vibratory stimulus as a neurorehabilitation tool for stroke patients: proof of concept and tolerability test.

Therapeutic impact of low amplitude high frequency whole body vibrations on the osteogenesis imperfecta mouse bone.

Tilt vibratory exercise and the dynamic balance in fibromyalgia: A randomized controlled trial.

Tilting Whole Body Vibration improves quality of life in women with fibromyalgia: a randomized controlled trial.

Transmission of low-intensity vibration through the axial skeleton of persons with spinal cord injury as a potential intervention for preserving bone quantity and quality.
Transmission of whole body vibration and its effect on muscle activation.
Transmission of whole body vibration in children while standing.
Treatment of chronic lower back pain with lumbar extension and whole-body vibration exercise: a randomized controlled trial.
Treatment of posttraumatic arthrofibrosis of the radioulnar joint with vibration therapy (VMTX Vibromax Therapeutics): a case report.
Triaxial modulation of the acceleration induced in the lower extremity during whole-body vibration training: a pilot study.
Understanding mechanisms and documenting plausibility of palliative interventions for dyspnea.
Update on vibration therapy for bone health. Can gentle vibration improve bone density and prevent fractures after menopause?
Use of vibration exercise in spinal cord injury patients who regularly practise sport.
Use of vibration therapy in the treatment of diabetic peripheral small fiber neuropathy.
Using whole-body vibration training in patients affected with common neurological diseases: a systematic literature review.
Variation in neuromuscular responses during acute whole-body vibration exercise.
Vascular adaptation to deconditioning and the effect of an exercise countermeasure: results of the Berlin Bed Rest study.
Vascular adaptations induced by 6 weeks WBV resistance exercise training.
Vastus lateralis oxygenation and blood volume measured by near-infrared spectroscopy during whole body vibration.
Vertical whole-body vibration does not increase cardiovascular stress to static semi-squat exercise.
Vibration and its effects on the body.
Vibration and stretching effects on flexibility and explosive strength in young gymnasts.
Vibration as an exercise modality: how it may work, and what its potential might be.
Vibration effects on static balance and strength.
Vibration elicits involuntary, step-like behavior in individuals with spinal cord injury.
Vibration exercise for treatment of osteoporosis: a theoretical model.
Vibration exercise makes your muscles and bones stronger: fact or fiction?
Vibration exercise: the potential benefits.
Vibration or Balance Training on Neuromuscular Performance in Osteopenic Women.
Vibration platform training in women at risk for symptomatic knee osteoarthritis.
Vibration therapy reduces plasma IL6 and muscle soreness after downhill running.
Vibration therapy.
Vibration training and metabolism: a comment on Artero et al. (2011).
Vibration training improves balance in unstable ankles.
Vibration training in elite sport: effective training solution or just another fad?
Vibration training intervention to maintain cartilage thickness and serum concentrations of cartilage oligomeric matrix protein (COMP) during immobilization.
Vibration training: benefits and risks.
Vibration training: could it enhance the strength, power, or speed of athletes?
Vibration treatment in cerebral palsy: A randomized controlled pilot study.
Vibration-induced changes in EMG during human locomotion.
Vibration-induced extra torque during electrically-evoked contractions of the human calf muscles.
Vibration-induced motor responses of infants with and without myelomeningocele.
Vibrations and their applications in sport. A review.
Vibratory therapeutics.--The application of rapid and continuous vibrations to the treatment of certain diseases of the nervous system. 1892.
Vibrotactile stimulation of the upper leg: effects of location, stimulation method and habituation.
Voluntary activation of the ankle plantar flexors following whole-body vibration.
Weight bearing through lower limbs in a standing frame with and without arm support and low-magnitude whole-body vibration in men.
Whole body vibration added to endurance training in obese women - a pilot study.
Whole body vibration as an adjunct to static stretching.
Whole body vibration compared to conventional physiotherapy in patients with gonarthrosis: a protocol for a randomized, controlled study.
Whole body vibration does not potentiate the stretch reflex.
Whole body vibration exercise improves body balance and walking velocity in postmenopausal osteoporotic women treated with alendronate.
Whole body vibration exercise: are vibrations good for you?
Whole body vibration exercise: training and benefits.
Whole body vibration for older persons: an open randomized, multicentre, parallel, clinical trial.
Whole body vibration improves the single-leg stance static balance in women with fibromyalgia: a randomized controlled trial.
Whole body vibration in cystic fibrosis--a pilot study.
Whole body vibration increases area and stiffness of the flexor carpi ulnaris tendon in the rat.
Whole body vibration increases hip bone mineral density in road cyclists.
Whole body vibration is a safe exercise training method and induces no impaired alterations on rat plasma parameters.
Whole body vibration therapy in fracture prevention among adults with chronic disease.
Whole body vibration therapy in patients with Duchenne muscular dystrophy - a prospective observational study.
Whole Body Vibration Training is Osteogenic at the Spine in College-Age Men and Women.
Whole body vibration reduces plantar foot sensitivity but improves balance control of healthy subjects.
Whole body vibration versus conventional physiotherapy to improve balance and gait in Parkinson's disease.
Whole body vibration: a new therapeutic approach to improve muscle function in cystic fibrosis?
Whole-body vibration alters blood flow velocity and neuromuscular activity in Friedreich's ataxia.
Whole-body vibration and resistance exercise prevent long-term hindlimb unloading-induced bone loss: independent and interactive effects.
Whole-body vibration and the prevention and treatment of delayed-onset muscle soreness.
Whole-body vibration as potential intervention for people with low bone mineral density and osteoporosis: a review.
Whole-body vibration attenuates the increase in leg arterial stiffness and aortic systolic blood pressure during post-exercise muscle ischemia.
Whole-body vibration augments resistance training effects on body composition in postmenopausal women.
Whole-body vibration can reduce calciuria induced by high protein intakes and may counteract bone resorption: A preliminary study.
Whole-body vibration decreases the proliferative response of TCD4(+) cells in elderly individuals with knee osteoarthritis.
Whole-body vibration dosage alters leg blood flow.
Whole-body vibration during passive standing in individuals with spinal cord injury: effects of plate choice, frequency, amplitude, and amplitudemodulation.
Whole-body vibration effects on bone before and after hind-limb unloading in rats.
Whole-body vibration exercise affects bone mineral density in women with or without resistance training.
Whole-body vibration for functional constipation: a single-centre, single-blinded, randomized controlled trial.
Whole-body vibration for patients with chronic obstructive pulmonary disease - 'thoughts for clinical practice'.
Whole-body vibration has no effect on neuromotor function and falls in chronic stroke.
Whole-body vibration improves functional recovery in spinal cord injured rats.
Whole-body vibration improves walking function in individuals with spinal cord injury: a pilot study.
Whole-body vibration in addition to strength and balance exercise for falls-related functional mobility of frail older adults: a single-blind randomized controlled trial.
Whole-body vibration increases upper and lower body muscle activity in older adults: potential use of vibration accessories.
Whole-body vibration slows the acquisition of fat in mature female rats.
Whole-body vibration strengthening compared to traditional strengthening during physical therapy in individuals with total knee arthroplasty.
Whole-Body Vibration Therapy for Osteoporosis [Internet].
Whole-body vibration therapy for osteoporosis: state of the science.
Whole-body vibration training compared with resistance training: effect on spasticity, muscle strength and motor performance in adults.
Whole-body vibration training elevates creatine kinase levels in sedentary subjects.
Whole-body vibration training for patients with neurodegenerative disease.
Whole-body vibration training improves flexibility, strength profile of knee flexors, and hamstrings-to-quadriceps strength ratio in female young adults.
Whole-body vibration training increases muscle strength and mass in older women: a randomized-controlled trial.
Whole-body vibration training increases vertical jump height in a dance population.
Whole-body vibration training reduces arterial stiffness, blood pressure and sympathovagal balance in young overweight/obese women.
Whole-body vibration training: metabolic cost of synchronous, side-alternating or no vibrations.
Whole-body vibration versus proprioceptive training on postural control in post-menopausal osteopenic women.
Whole-body vibration training increases knee-extension strength and speed of movement in older women.
Will whole-body vibration training help increase the range of motion of the hamstrings?
